Component Responsibilities

What each file owns and where to edit when something changes

Public Pages (*.html)

Thin wrappers — just markup unique to that page.

- Include shared `nav / footer` via `data-include` placeholders.
- Reference `css/style.css` for all styling.
- Pull data via `js/notices.js`, `js/documents.js`, `js/representatives.js`.

Shared Layer

- **css/style.css** — single source of truth for visual design (colors, layout, mobile responsive rules).
- **partials/nav.html** — edit once → applies to all 8 pages.
- **partials/footer.html** — same idea, plus the floating WhatsApp button.
- **js/include.js** — loads partials with `fetch()`, sets `active` nav link based on `<body data-page>`.

Editable Content

- **content/notices.md** — Markdown. Non-technical editors add `## Title` blocks with `urgent: true / icon: / deadline:` metadata.
- **js/representatives.js** — array of `{name, dept, flat, photo}`. Auto-sorted alphabetically.
- **Document/<Category>/** — drag-and-drop folders. Filename becomes title; size auto-detected.

Renderers (run in browser)

- **js/notices.js** — fetches `content/notices.md`, parses headings + metadata + button links, renders into `#urgentNotices` and `#noticeList`.
- **committee.html (inline)** — reads `window.REPRESENTATIVES`, escapes/sorts/renders alphabetized cards into `#replList`.
- **js/documents.js** — calls GitHub Contents API `/repos/tkundan/orchid-society-website/contents/Document/`, lists subfolders as categories, lists files as downloads, links to `raw.githubusercontent.com`.

Hosting & Delivery

- **GitHub Pages** serves all static assets — HTML/CSS/JS/PDF/images.
- **GitHub API** (`api.github.com`) drives auto-discovery on the Documents page. Public repo = no auth required. Rate limit: 60 req/hour per visitor IP.
- **Google Fonts CDN** ships Playfair Display + DM Sans.

Maintenance Cheat Sheet

- **Add a notice** → edit `content/notices.md`
- **Add a representative** → edit `js/representatives.js`
- **Upload a document** → drop file into right `Document/<Category>/` folder
- **Add a new page** → copy any `*.html`, add link to `partials/nav.html`, set `data-page` on `<body>`
- **Change a color / layout** → `css/style.css` only
